

6 Refrigerators can be problematic in hot weather, as ambient temperatures rise, gas electric refrigerators become less efficient. It's not uncommon for the refrigerator compartment to become so warm that it's impossible to keep food for any period of time. Most modern refrigerators come with some type of a cooling fan in the rear of the refrigerator incorporated into the cooling unit. These fans can and will stop functioning causing a problem with cooling efficiency during hot weather. If you've had trouble with the refrigerator in the past camping in hot weather, I would recommend having at least two exhaust fans installed in the back of your refrigerator compartment on the access door.

ARPrv website (arprv.com) is a really good source for refrigerator questions, fans, and safety devices for any type of gas electric refrigerator.
